Original document

This document is an original document of SICK AG.

Contents

1 About this document

Please read this chapter carefully before beginning to use the telegram listing.

The document shows how to send telegrams via a terminal program using the SICK protocol CoLa A (ASCII and hexadecimal values, with TCP port 2111 or 2112) or CoLa B (binary/hexadecimal values, with TCP port 2112 only) to the laserscanners LMS1xx, LMS5xx, TiM5xx (TiM55x, TiM56x, TiM57x), MRS1000, NAV310, LD-OEM15xx and LD-LRS36xx. This comprises the query of the current device state or certain parameter values, how to modify parameter values and the way in which the device confirms or responds to commands/telegrams.

The devices generally support automatic IP address discovery. Default IP address is:

- LMSxxx: 192.168.0.1
- TiM5xx: 192.168.0.1
- MRS1000: 192.168.0.1
- NAV310: 192.168.1.10
- LD-XXXxxxx: 192.168.1.10

Subnet mask is 255.255.255.0.

IP ports:

- 2111: CoLa A (fixed)
- 2112: CoLa A (can be switched to CoLa B)
- 2213: UDP

The document does not or only in a few exceptional cases differentiate between individual device versions or sub product families such as LMS5xx Lite and LMS5xx PRO. Most parameter changes also require certain user levels. Additionally, commands may change during the product lifecycle and development process with a new firmware.

This telegram listing is based on the following firmware statuses (or newer):

- LMS1xx: V1.80 (V1.21 for LMS12x/13x)
- LMS5xx: V1.50.6 (V31.39 for LMS531)
- TiM5xx: V2.51
- MRS1000: 1.0.0 (1.0.0.0R)
- NAV310: V1.03
- LD-OEM15xx: V1.12 (V1.32 for OEM1500)
- LD-LRS36xx: V1.12 (V1.32 for LRS3600)

If commands do not seem to work, please verify that your device version supports this functionality, that the minimum required user level has been selected and check on updates of this documentation.

2 Communication format

2.1 Binary telegram (CoLa B)

The binary telegram is the basic protocol of the scanner (CoLa B). All values are in hexadecimal code and grouped into pairs of two digits (= 1 byte). The string consists of four parts: header, data length, data and checksum (CS).

The header indicates with 4 × STX (02 02 02 02) the start of the telegram.

The data length defines the size of the data part (command part) by indicating the number of digit pairs in the third part. The size of the data length itself is 4 bytes, which means that the data part might have a maximum of 16^8 = 4,294,967,295 digit pairs.

The data part comprises the actual command with letters and characters converted to Hex (according to the ASCII chart) and the parameters of either decimal numbers converted to Hex or fixed Hex values with a specific, intrinsic meaning (no conversion). There is always a blank (20) between the command and the parameters, but not between the different parameter values.

The checksum finally serves to verify that the telegram has been transferred correctly. The length of the checksum is 1 byte, CRC8. It is calculated with XOR.

Example: Binary telegram

02 02 02 02	00 00 00 17	73 4D 4E 20 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 03 F4 72 47 44	B3
Header	Length	Data	CS

Table 1: Example: Binary telegram

This is an example telegram for setting the user level “Authorized Client”:

- Header = 02 02 02 02
- Length = 23 digit pairs (17h)
- Data:
  - 73 4D 4E 20 = sMN = start of Sopas command (and blank)
  - 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 = Set Access Mode = the actual command for setting the user level (and blank)
  - 03 = fixed Hex value meaning user level “Authorized Client”
  - F4 72 47 44 = fixed Hex value, serving as password for the selected user level “Authorized Client”
- Checksum = B3 from XOR calculation

2.2 ASCII telegram (CoLa A)

The ASCII telegram is an alternative to the binary telegram. Due to the variable string length of ASCII telegrams, the Binary telegram is recommended when using scanners with a PLC.

The ASCII telegram has the advantage that commands can be written in plaintext. The string consists only of two parts: the framing and the data part.

The framing indicates with <STX> and <ETX> the start and stop of each telegram.

The data part comprises the actual command with letters and characters (plaintext), parameter values either in decimal (special indicator required) or in hexadecimal (example: a frequency of 25 Hz = +2500 (decimal) = 09C4 (Hex)) and fixed hexadecimal values with a specific, intrinsic meaning. As leading zeros are being deleted, there is always a blank required between all command parts and parameter parts.

NOTE

The device will comfirm parameter values always in hexadecimal code, regardless of the code sent.

As further alternative within CoLa A, depending on the preferences of the user, all values can be written directly in Hex. This means however a 1:1 conversion of all letters and characters including numbers and fixed hexadecimal values via the ASCII chart.

Example: ASCII telegram

ASCII	<STX>	sMN{SPC}SetAccessMode{SPC}03{SPC}F4724744	<ETX>
Hex	02	73 4D 4E 20 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 30 33 20 46 34 37 32 34 37 34 34	03
	Start	Data	Stop

Table 2: Example: ASCII telegram

This is again an example telegram for setting the user level “Authorized Client”. As only fixed hexadecimal parameter values are needed, the option to use parameter values in decimal code with special indicator cannot be applied here:

- Framing = <STX> = telegram start = 02 (Hex)
- Data:
  - sMN = start of Sopas command (and blank) = 73 4D 4E 20 (Hex)
  - SetAccessMode = the actual command for setting the user level (and blank) = 53 65 74 41 63 63 65 73 73 4D 6F 64 65 20 (Hex)
  - 03 = fixed Hex value meaning user level “Authorized Client” (and blank) = 30 33 20 (Hex)
  - F4 72 47 44 = fixed Hex value, serving as password for the selected user level “Authorized Client” = 46 34 37 32 34 37 34 34 (Hex)
- Framing = <ETX> = telegram stop = 03 (Hex)

2.3 Variable types

Variable type	Length (byte)	Value range	Sign
Bool_1	1	0 or 1	No
Uint_8	1	0 ... 255	No
Int_8	1	-128 ... +127	Yes
Uint_16	2	0 ... 65,535	No
Int_16	2	-32,768 ... +32,767	Yes
Uint_32	4	0 ... 4,294,967,295	No
Int_32	4	-2,147,483,648 ... +2,147,483,647	Yes
Enum_8	1	Certain values defined in a list of Choices (0 ... 255)	No
Enum_16	2	Certain values defined in a list of Choices (0 ... 65535)	No
String	Context-dependent	Strings are not terminated in zeroes	
Real		Float nach IEEE754 (see www.h-schmidt.net/FloatConverter/IEEE754de.html)	

Data length is always given in Bytes!

2.4 Command basics

Description	Value ASCII	Value Hex	Value Binary
Start of text	<STX>	02	02 02 02 02 + given length
End of text	<ETX>	03	Calculated checksum
Read	sRN	73 52 4E	
Write	sWN	73 57 4E	
Method	sMN	73 4D 4E	
Event	sEN	73 45 4E	
Answer	sRA	73 52 41	
	sWA	73 57 41	
	sAN	73 41 4E	
	sEA	73 45 41	
	sSN	73 53 4E	
Space	{SPC}	20	20

If values are divided into two parts (e.g. measurement data), they are documented according to LSB 0 (e.g. 00 07), output however is according to MSB (e.g. 07 00).

2.5 Log in: Required user level

Task	Required user level
Change sensor parameters	Authorized Client
Requests or queries (e.g. for measurement data or device state)	None
Manage password	Service

3 Workflows

3.1 Parameterize the scan

1 Log in: sMN SetAccessMode (see 4.1, page 12)
2 Set frequency and resolution: sMN mLMPsetscancfg (see 4.2.1, page 14)
3 Configure scandata content: sWN LMDscandatacfg (see 4.3.1, page 55)
4 Configure scandata output: sWN LMPoutputRange (see 4.3.2 page 58)
5 Store parameters: sMN mEEwriteall (see 4.2.20, page 52)
6 Log out: sMN Run (see 4.2.21, page 53)
7 Request scan:
sRN LMDscandata (see 4.3.4, page 62)
sEN LMDscandata (see 4.3.5, page 63)

(Device output ...)

More detailed command descriptions can be found in the course of this document.

Example: Sequence for LD-OEM1501, NAV310, LD-LR3601, LD-LR3611 to configure 2 sectors and get measurement scans

Sector configuration: Resolution: 10Hz; 0,125°;
Sector 1: 0° ... 44°(0h ... 6B6C0h);
Sector 2: 45° ... 180° (6DDD6h ... 1B7740h)

1 Stop measurement: sMN LMCstopmeas
sAN LMCstopmeas 0
2 Log in: sMN SetAccessMode (see 4.1, page 12)
3 Set Sectors : LCMstate001B7740 04E2 000000 0000000 04E2 000000 000000
sAN mLMPsetscancfg 0 3E8 2 4E2 0 6B6C0 4E2 6DDD6 1B7740 4E2 0 0 4E2 0 0
4 Store parameters: sMN mEEwriteall (see 4.2.20, page 52)
5 Log out: sMN Run (see 4.2.21, page 53)
6 Start Measurement: sMN LMCstartmeas
sAN LMCstartmeas 0
7 Request scan:
sRN LMDscandata (see 4.3.4, page 62)
sEN LMDscandata (see 4.3.5, page 63)

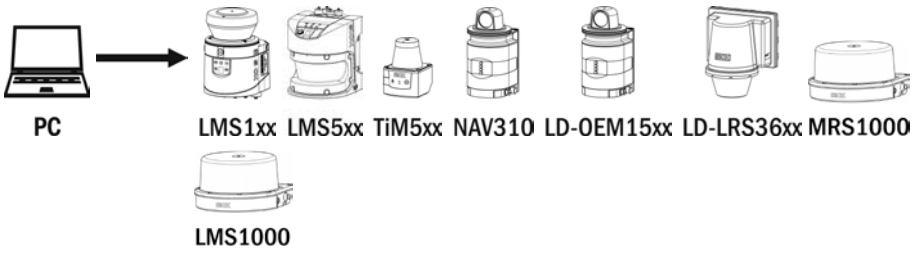
(Device output ...)

3.2 Set timestamp/data angle

1 Log in: sMN SetAccessMode (see 4.1, page 12)
2 Sopas command: sMN LSPsetdatetime (see 4.4.1, page 80)
3 Log out: sMN Run (see 4.2.21, page 53)

4 Telegrams

4.1 Log in



Telegram structure: sMN SetAccessMode

Table 6: Example for LMS100: sAN SetAccessMode

4.2 Basic Settings

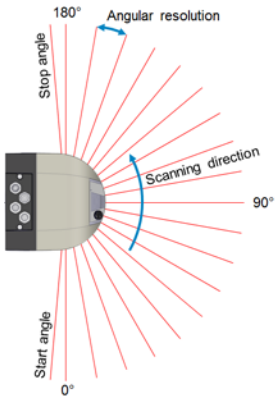
4.2.1 Set frequency and angular resolution/measurement sectors

NOTES

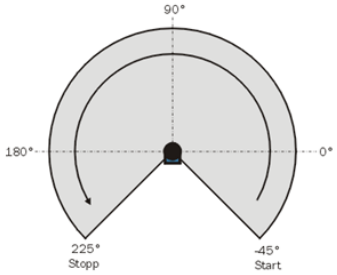
- Please note that the new values will be activated only after log out (from the user level), when re-entering the Run mode (see Table 94 on page 53).

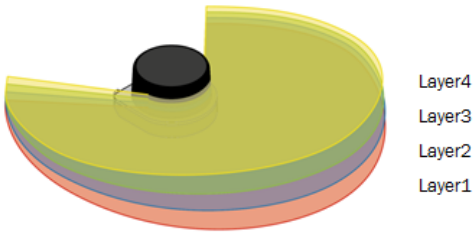
Coordination system of:

LMS5xx (-5° to 190°)



LMS1xx and TiM5xx (-45° to 225°); LMS/MRS1000 (-47,5° to 227,5°)





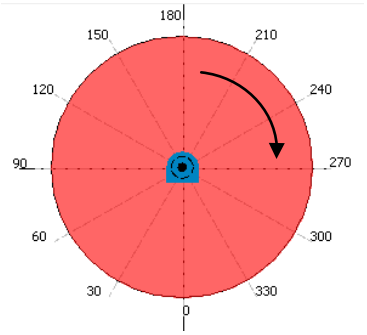
Sequence of the Layers In the Telegram

(Output sequence (DIN70000): 0, -250, 250, -500)

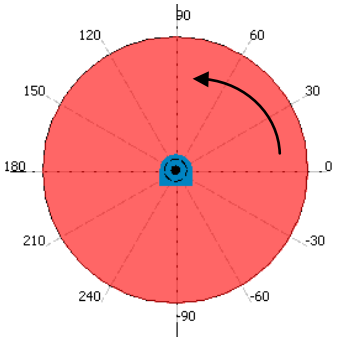
0	→ 0	Layer2
FF06	→ -250	Layer3
FA	→ 250	Layer1
FE0C	→ -500	Layer4

The LD series is available in two versions having a different rotation direction and coordinate system:

LD-OEM1501, NAV310, LD-LR3601, LD-LR3611 (0° to 360°)



LD-OEM1500 and LD-LR3600 (–90° to +270°)



For sending the sector configuration there follow these rules:

- Send the sectors in their ascending sequence.
- For LD and NAV products: Send allways the definition for all sectors (unused sector as “{SPC}0{SPC}0”.)
- For LMS products: They have only one measurement sector, send only the first one and leave the rest away.

For more details on sector configuration see examples below.

For complete workflow see example in section 3, page 11.

Telegram structure: sMN mLMPsetscancfg (Authorized client)

4.2.4 Set scan configuration

Sets the device to an defined scan configuration, consisting of scan frequency, angular resolution, sector definition and interlace mode.

Telegram structure: sMN mCLsetscancfglist						
Telegram part	**Description**	**Variable**	**Length**	**Sensor**	**Values CoLa A (ASCII)**	**Values CoLa B (Binary)**
Command type	Method	String	3	All	sMN	73 4D 4E
Command	Set scan configuration	String	17	All	mCLsetscancfglist	6D 43 4C 73 65 74 73 63 61 6E 63 66 67 6C 69 73 74
Mode	Interlace mode (see table below)	Enum_8	1	All	+1d, +2d, +3d ... (01h, 02h, 03h ...)	01, 02, 03 ...

Table 27: Telegram structure: sMN mCLsetscancfglist

Interlace mode

The interlace mode allows to achieve a higher angular resolution by combining scans with lower resolution. The individual scans are shifted to each other.

The command *mCLsetscancfglist* selects combinations of scan resolution, scan frequency and resolution. If the scan area will not match to the application then an adjustment is possible by the command “mLMPsetscancfg” (see section 4.2.1 “Set frequency and angular resolution/measurement sectors” on page 14).

Mode	Inter-laced	Scan freq.	Result. scan freq.	Reso-lution	Total Resol.	Field of view	Sector	LRS 3601 3611	OEM 1501	NAV 310	LRS 3600	OEM 1500

Table 45: Example: sMN LMPautostartmeas

This parameter defines wether the scanner will start upon powering up to rotate and measure of remain in the idle mode.

The setting should be stored in the flash memory by the command sMN mEEWriteall.

After the next powering up the scanner will be either in the idle or in the measurment mode.

Table 104: Telegram structure: sWN LMPoutputRange

[2] Note: Angular resolution can not be changed here, it is taken automatically from the basic scan settings! The angular resolution is not exactly 0.1667 degree, and this value should not be used for calculations. The result is an angular resolution of 0,1$\overline{6}$ or 1/6 of a degree (six measurements per degree). When used for calculations a customer should recover the real value, e.g. by double AngRes = 2.0 / round(2.0 / GivenAngRes).

4.3.4 Poll one Telegram

Output of values from last scan.

Asking the device for the measurement values of the last valid scan. The device will respond, even if it is not running at the moment.

NOTE

After changing the scanning frequency, there will be no data telegram or answer from the devices LMS1xx, LMS5xx and TiM5xx for up to 30 seconds.The same applies when the device is powering up or rebooting.

For NAV310/LD-OEM15xx/LRS: The array “Output channel 16 bit ” has various dimensions “Amount of 16 Bit Channels”, depending on the amount of sectors and if RSSI (output of remission values) is selected as on or off: • If RSSI was not selected (by LMDscandatacfg); there are 2 channels with the contents ○ Channel 1: First sector (Test target), content: DIST1 ○ Channel 2: Second sector (Main profile data), content: DIST1 • If RSSI was selected (by LMDscandatacfg); there are 4 channels with the contents ○ Channel 1: First sector (Test target), content: DIST1 ○ Channel 2: First sector (Test target), content: RSSI1 ○ Channel 3: Second sector (Main profile data), content: DIST1 ○ Channel 4: Second sector (Main profile data), content: RSSI1 The number behind DIST and RSSI is the order number of the pulse. As the NAV310/LD-OEM15xx/LD-LRS36xx scanner are working with a single pulse measurement, it is always “1”.

Table 120: Telegram structure: Datastream of sRA LMDscandata/sSN LMDscandata

NOTE

- The grey written parts are not given out by the sensor.
- The event information is not available with the LMS1xx and with the LMS5xx only with firmware V1.20 or higher.
- The order of events within the data structure is “newest” first.

LMDscandata - reserved values

Valid measurement values are values starting from 16d upwards, everything below has the following meaning:

Value	RSSI	Description
0d	0h	no meas value detected; means that in the angle, there was no valid measurement value. Probably the object to measure was out of the range of the or the object was reflecting too less light back (black objects)
1d	FFFFh (16Bit output) FFh (8Bit output)	dazzled, geblendet
2d	0h	implausible measurement values
3d	0h	value was set to invalid by a filter (Echo Filter, Particle Filter in old firmware)
4d – 15d	0h	reserved, at the moment not given out, if there occurs a value in that range anyway → perform a Softwareupdate
>16d	>0h	valid measurement values

Valid for LMS1xx/5xx, TiM5xx

max. measurement value TiM5xx: Dez: 10.000mm --> Hex: 2710
max. measurement value TiM57x: Dez: 25.000mm --> Hex: 61A8
max. measurement value LMS1xx: Dez: 20.000mm --> Hex: 4E20
max. measurement value LMS15x: Dez: 50.000mm --> Hex: C350
max. measurement value LMS5xx: Dez: 65.000mm --> Hex: FDE8
max. measurement value LMS5xx: Dez: 80.000mm --> Hex: 9C40 with scale factor 2 --> 13880

Higher measurement values will be given out with a zero, that means no measurement value detected.

Calculation and amount of data for LMS5xx

Example how to calculate the amount of data for a measurement telegram.

Sizes of values and telegram parts:

- one measurement value: 5 byte (4 byte value itself, 1 byte blank after the value)
- one RSSI value: 3 byte (2 byte value itself, 1 byte blank after the value)
- telegram header: 81 byte
- telegram end: 12 byte

Calculation of number of Measurement values depends always on the resolution:

0.5° = 2 measurements per degree

0.25° = 4 measurements per degree

Always one additional measurement for the last measurement

Number of measurement values =

Number of degrees × measurements per degree + 1

Example for measurement of 56° in 0.5° resolution (without RSSI data):

56 × 2 + 1 = 113 Measurement values

Amount of Data for this measurement values:

113 × 5 Byte = 565 Byte

Calculation of amount of data per telegram:

Data of one Telegram = Header + Measurements + end of telegram

81 Byte + 113 Measurements + 12 Byte

81 Byte + (113 × 5Byte) + 12 Byte =

658 Byte per Telegram (= 5264 Bit (658 × 8 Bit))

Possible amout for delivery with special Speed:

Number of telegrams per second = Speed ÷ telegram size

Speed Example:

115200 Bit/s = 11520 Byte/s = 11,52 Byte/s

11520 (Byte/s) ÷ 658 Byte = 17,5 Telegrams/s

Telegram size with **0,25°** resolution:

Degrees: 270°

Resolution: 0.25°

→Measurement Values = 270 × 4 + 1 = 1081

Data per Telegram =

81 Byte + (1081 × 5 Byte) + 12 Byte = **5498 Byte** (= 43984 Bit)

Telegram size with **0,5°** resolution:

Degrees: 270°

Resolution: 0.5°

→Measurement Values = 270 × 2 + 1 = 541

Data per Telegram =

81 Byte + (541 × 5 Byte) + 12 Byte = **2798 Byte** (= 22384 Bit)

As a result in that configuration a 10 MBit connection will not be enough. With a 100 MBit Hub, 3-4 scanner can be used, with a 1 GBit Hub accordingly more.

Example of a telegram stream

Example: telegram LMS1xx, LMS5xx similar with corresponding values (10°-20° data range)

Table 121: Example of one telegram stream

4.4 Time stamp

4.4.1 Set time stamp

The data format in the telegram is:
+2009{SPC}+7{SPC}+22{SPC}+12{SPC}+0{SPC}+0{SPC}+0.
The numbers represent year, month, day, hour, minute, second, microsecond).

If plus is used up-front the data it is interpreted as an integer decimal number, without the plus it's the scanner reads the data as hex format.

The answer is always in ASCII format.

Attention: There is no real time clock inside the device. When the scanner is switched off and after a reboot, the time has to be set again.

However, it is possible to analyze the Off-time in order to evade this issue.

4.9.4 Status commands for LD-XXX and NAV310

The following status commands will be explained in the subsequent sections:

- LMCmeasstate: Status of the internal Statemachine
- SCdevicestate: Status of the Sensors (actual measurement status)
- EMCustomerInfo: Additional error information
- LDMSenStat: Status of the state machine of the measurment core, Motor status

How status commands for for LD-XXX and NAV310 work together:

- If LMCmeasstate changes to “Idle” or an other status, although the measurement status “Measure2D” is expected, there is an error during the measurement (or during start up of the measurement).
- SCdevicestate is always "Ready", if the measurement is active.
  If “Busy” will be indicated the unit is not measuring (e.g, IDLE). If there is any failure “Error” will be indicated. (However LMCmeasstate could indicate “Measure2D”, if the failure occurs during the measurement, because it is only an indication of the status of the State machine).
- In case of a failure EMCustomerInfo can provide an information about the error.
  In case of an motor failure there are following condition visible:
  - Motor blocked during operation ➜ DEVICE_FAILURE
  - Motor blocked during spin up ➜ CHECK_PARAMETER
- It is also possible to read LDMSenStat (and to register as an event). This value equals the Sensorstatus of the NAV310/LD-XXX. A status “B1” of the measurement core means “Motor error and Idle”).
- During the measurement it is possible to monitor a deviation of the target rotation frequency. (If the device detects rotation values that are too slow, it will terminate the measurement.)

In case of an failure this value will not always be updated, therefore it is necessary to monitor LMCmeasstate and SCdevicestate in parallel.

NOTE

- In case of an failure (Scanner does not change to MEASURE2D or switches back to IDLE), it is necessary to send the command LMCstopmeas (even if the Status is indicated as IDLE)
- If at EMCustomerInfo the message CHECK_PARAMETER is indicated, a reset is only possible by a power cycle of the scanner.

Table 339: Example: sRA MCAngleCompSin

The values of the angular compensation could be retrieved form the memory of the NAV310 to improve the angular measurement accuracy.

The applied formula is:

AngleComp = AngleRaw + (AngleCompAmp * sin(AngleRaw - AngleCompPhase) + AngleCompOffset

Example (C coded):

```
angleRaw: Raw angle as float in degrees (0.000 ... 359999)
angleComp:Compensated angle as float in degrees (0.000 ... 359999)
AngleCompAmp
AngleCompPhase
AngleCompOffset: Compensation parameters as int in 1/1000 degrees
float compensateAngle(float angleRaw)
{
    float angleComp;
    angleRaw += ((float) AngleCompOffset)/1000.0;
    angleRaw += (((float) AngleCompAmp)/1000.0) *
        sin((DEGTORAD * (angle - ((float) AngleCompPhase)/1000.0)));
    return angleComp;
}
```

4.10.12 Set front LEDs

To use this command, it is necessary to set the function of the LED to “Command” (use sWN LMLfpFcn), otherwise this command will have no influence to the LEDs.

OK and Stop LED can only alternate, if one is switched on, the other will turn automatically off.

5 Diagnostics

5.1 SOPAS error codes

sFA ErrorCode

Telegram structure: sFA ErrorCode			
Error code	**Description**	**Dec.**	**Hex.**
Sopas_Ok	No error	0	0
Sopas_Error_METHODIN_ACCESSDENIED	Wrong userlevel, access to method not allowed	1	1
Sopas_Error_METHODIN_UNKNOWNINDEX	Trying to access a method with an unknown Sopas index	2	2
Sopas_Error_VARIABLE_UNKNOWNINDEX	Trying to access a variable with an unknown Sopas index	3	3
Sopas_Error_LOCALCONDITIONFAILED	Local condition violated, e.g. giving a value that exceeds the minimum or maximum allowed value for this variable	4	4
Sopas_Error_INVALID_DATA	Invalid data given for variable, this errorcode is deprecated (is not used anymore).	5	5
Sopas_Error_UNKNOWN_ERROR	An error with unknown reason occurred, this errorcode is deprecated.	6	6
Sopas_Error_BUFFER_OVERFLOW	The communication buffer was too small for the amount of data that should be serialised.	7	7
Sopas_Error_BUFFER_UNDERFLOW	More data was expected, the allocated buffer could not be filled.	8	8
Sopas_Error_ERROR_UNKNOWN_TYPE	The variable that shall be serialised has an unknown type. This can only happen when there are variables in the firmware of the device that do not exist in the released description of the device. This should never happen.	9	9
Sopas_Error_VARIABLE_WRITE_ACCESSDENIED	It is not allowed to write values to this variable. Probably the variable is defined as read-only.	10	A
Sopas_Error_UNKNOWN_CMD_FOR_NAMESERVER	When using names instead of indices, a command was issued that the nameserver does not understand.	11	B
Sopas_Error_UNKNOWN_COLA_COMMAND	The CoLa protocol specification does not define the given command, command is unknown.	12	C
Sopas_Error_METHODIN_SERVER_BUSY	It is not possible to issue more than one command at a time to an SRT device.	13	D
Sopas_Error_FLEX_OUT_OF_BOUNDS	An array was accessed over its maximum length.	14	E
Sopas_Error_EVENTREG_UNKNOWNINDEX	The event you wanted to register for does not exist, the index is unknown.	15	F

Telegram structure: sFA ErrorCode			
Error code	**Description**	**Dec.**	**Hex.**
Sopas_Error_COLA_A_VALUE_OVERFLOW	The value does not fit into the value field, it is too large.	16	10
Sopas_Error_COLA_A_INVALID_CHARACTER	Character is unknown, probably not alphanumeric.	17	11
Sopas_Error_OSAI_NO_MESSAGE	Only when using SRTOS in the firmware and distributed variables this error can occur. It is an indication that no operating system message could be created. This happens when trying to GET a variable.	18	12
Sopas_Error_OSAI_NO_ANSWER_MESSAGE	This is the same as `Sopas_Error_OSAI_NO_MESSAGE` with the difference that it is thrown when trying to PUT a variable.	19	13
Sopas_Error_INTERNAL	Internal error in the firmware, problably a pointer to a parameter was null.	20	14
Sopas_Error_HubAddressCorrupted	The Sopas Hubaddress is either too short or too long.	21	15
Sopas_Error_HubAddressDecoding	The Sopas Hubaddress is invalid, it can not be decoded (Syntax).	22	16
Sopas_Error_HubAddressAddressExceeded	Too many hubs in the address	23	17
Sopas_Error_HubAddressBlankExpected	When parsing a HubAddress an expected blank was not found. The HubAddress is not valid.	24	18
Sopas_Error_AsyncMethodsAreSuppressed	An asynchronous method call was made although the device was built with “AsyncMethodsSuppressed”. This is an internal error that should never happen in a released device.	25	19
Sopas_Error_ComplexArraysNotSupported	Device was built with „ComplexArraysSuppressed“ because the compiler does not allow recursions. But now a complex array was found. This is an internal error that should never happen in a released device.	26	20

Table 404: SOPAS error codes

Example: sFA ErrorCode Wrong userlevel

CoLa A	ASCII	<STX>sFA{SPC}01<ETX>
	Hex	02 73 46 41 20 30 31 03
CoLa B	Binary	02 02 02 02 00 00 00 05 73 46 41 20 01 55

Table 405: Example: sFA ErrorCode Wrong userlevel

5.2 Additional information

Every response telegram starts with a separat framed string:

<STX>sSI 2 1<ETX><STX>“Answer”<ETX>

If it is an event from SOPAS, send command: <STX>sEN SCParmChngd 0<ETX> to deactivate that event.
